

#### Notes for Responsive Layout Systems Build:

- I did not use subgrid at this stage because the vendor cards and schedule items do not currently need internal rows to align and their existing grid layouts provide the alignment needed for the current content.
- Added a breakpoint for the nav bar to allow for tablet/mobile sizing. The column becomes more intentional at this point. I will be making this a dropdown menu in mobile/tablets further down the line, but feel this satisfies the assignment requirements for now.
- Added reduced motion. While no animations/transitions are currently present, I may include them and this will build the foundation for this and accessibility.
- The vendor card uses a stacked layout. If container queries are unsupported, the card still remains usable in the added layout.
- HTML is not completed and I intend on adding many more CSS tweaks and features.

#### Testing Evidence:

- Narrow: Works
- Medium: Works
- Wide: Works
- 200% Zoom: Works
- Keyboard focus: Tabbed through links - works.

AI Disclosure: I used ChatGPT to help interpret the assignment requirements and what all is needing to be submitted. I still did not quite understand Preference/Fallback in testing evidence, so I did not include testing for this in this assignment. All the code is my own and based on MDN articles and further research such as StackOverflow.
